Chapter 5 Boundary Value Problems A boundary value problem for a given differential equation consists of finding a solution of the given differential equation subject to a given set of boundary conditions. A boundary condition is a prescription some combinations of values of the unknown solution and its derivatives at more than one point.

### **Finite Difference Method for a System of Third Order**

Third-Order Boundary-Value Problems M. A. NOOR 1 AND E. A. AL-SAID 2 Communicated by I. Galligani Abstract. In this paper, we develop a two-stage numerical method for computing the approximate solutions of third-order boundary-value problems associated with odd-order obstacle problems. We show that the present method is of order two. A numerical example is presented to illustrate the

### **Differential Equations Boundary Value Problems**

With boundary value problems we will have a differential equation and we will specify the function and/or derivatives at different points, which we ll call boundary values. For second order differential equations, which will be looking at pretty much exclusively here, any of the following can, and will, be used for boundary conditions.

Boundary value problems, are a somewhat different animal. In a boundary value problem we are trying to satisfy a steady state solution everywhere in space that agrees with our prescribed boundary conditions. For a ux conservative problem, the problem becomes finding the set of uxes at all the nodes such that for every node, what comes in goes out. In general, boundary value problems
